WOMEN WHO

CODE

Women Who Code Python

Python Libraries 101

OUR MISSION

Inspiring women to
excel in technology
careers.

WOMEN WHO
CODE

OUR VISION

A world where diverse women are better represented as engineers and leaders in technology.

WOMEN WHO
CODE

OUR TARGET

Engineers with two or more years of experience looking for support and resources to strengthen their influence and levelup in their careers.

WOMEN WHO
CODE

CODE OF CONDUCT

WWCode is an inclusive community, dedicated to providing an empowering experience for everyone who participates in or supports our community, regardless of gender, gender identity and expression, sexual orientation, ability, physical appearance, body size, race, ethnicity, age, religion, socioeconomic status, caste, creed, political affiliation, or preferred programming language(s).

Our events are intended to inspire women to excel in technology careers, and anyone who is there for this purpose is welcome. We do not tolerate harassment of members in any form. Our **Code of Conduct** applies to all WWCode events and online communities.

Today's Agenda

1. Introduction to the Series
2. What is the Python Standard Library?
3. Modules we'll be exploring today
 - a. `sys`
 - b. `os`
4. Setup and Guidelines
5. Hands-on Coding

Python Libraries 101

Welcome to the series!

- The series will cover popular Python libraries used everyday, over a range of fields.
- Each session will begin with a conceptual presentation followed by code walkthroughs and hands-on implementation.
- Sessions will be held [every week at 10 am EDT](#)

Welcome to the series!

- The series will start by exploring popular modules in the Python Standard Library such as
 - file system libraries `os` and `sys`,
 - math utilities `statistics`, `math` and `random` and
 - data type libraries `collections`, `datetime` and `calendar`.
- The python standard library will be followed by learning data visualization libraries `matplotlib`, `seaborn` and `plotly`.
- More libraries such as `tkinter`, `numpy`, `pandas`, `OpenCV` and more will be discussed further into the series!

Python Standard Library

What is the Python Standard Library?

- Python offers a lot of built-in functionality through its standard library.
- Built-in modules are written in C and integrated with the Python shell.
- The standard library is a huge collection of utilities, ranging from math utilities to debugging to creating graphical user interfaces. Popularly used modules are os, sys, json, re, random, math, urllib, tkinter, datetime

sys

Sys Module

- The sys module provides functions and variables used to manipulate different parts of the Python runtime environment.
- It provides access to the variables and functions that interact strongly with the interpreter
- For example;
 - `sys.argv` returns a list of command line arguments passed to a Python script.
- Syntax: *import sys*

Sys Module: Variables

- `sys.modules` displays a dictionary that maps module names to modules which have already been loaded
- `sys.platform` displays a string containing a platform identifier
- `sys.version` displays a string containing the version number of the current Python interpreter
- `sys.path` displays an environment variable that is a search path for all Python modules

Sys Module: Functions

- `sys.argv[index]` returns a list of command line arguments passed to a Python script.
- `sys.getsizeof(object)` returns the size of an object in bytes.
- `sys.stdin()` returns the input from the command line directly. It is used for standard input.
- `sys.stdout()` is used to display output directly to the output window.
- `sys.exit([arg])` is used to exit to either the Python console or the command prompt

OS

Os Module

- The OS module in Python provides functions for interacting with the operating system.
- The OS module in Python provides functions for creating and removing a directory, fetching its contents, changing and identifying the current directory and more.
- **Syntax:** *import os*

Os Module: Functions

- `os.getcwd()` returns the current working directory
- `os.mkdir(path+filename)` creates a new directory
- `os.chdir()` switch/change directories
- `os.rmdir(path)` removes the specified directory either with an absolute or relative path
- `os.listdir(path)` returns the list of all files and directories in the specified path
- `os.rename(src, dst)` renames the file or directory src to dst

Os Module: Functions

- `os.open(file, flags[, mode])` returns the file descriptor for the newly opened file
- `os.fchdir(fd)` change the current working directory to the directory represented by the file descriptor `fd`
- `os.environ()` is used to access environment variables
- `os.putenv(key, value)` sets the environment variable named `key` to the string value
- `os.path.join()` concatenates 2 strings together to make it a path

QnA Time!

Let's Code!
